Black-box testing

For the purpose of black-box testing, the source code should be invisible. Therefore we provide a script “install.sh” for generating the binary executable. By using the installation script, the tester need not to run the program by using Python interpreter to execute the python scripts.

```
cd <root>  
bash install.sh
```

Of course, if the tester wants, he/she can still check the source code. To ensure a strict black-box testing, one can remove `./src` after running ‘install.sh’.
